Conclusion:-

The experiment successfully demonstrated the design and implementation of a simple Progressive Web App (PWA) e-commerce wireframe. Various screens such as home, product details, cart, wishlist, and profile were structured to ensure smooth navigation and a user-friendly shopping experience. Dynamic features like cart updates and interactive elements were also incorporated, making the wireframe closer to a real-world application.

Furthermore, the integration of PWA components such as the manifest file and service worker enabled features like offline access and installability. This experiment highlights the importance of wireframing in planning application structure and shows how it can be extended into a fully functional, efficient, and responsive web application.
